Rapport nr. 85.168	ISSN 0800-3416	Åpen/ XXXXXX	
Tittel: Geokjemi i Nord-Trøndelag - humus i områdene vest for riksvei E6.			
Forfatter: Ola M. Sæther		Oppdragsgiver:	
Fylke: Nord-Trøndelag		Kommune:	
Kartbladnavn (M. 1:250 000)		Kartbladnr. og -navn (M. 1:50 000)	
Forekomstens navn og koordinater:		Sidetall: 46	Pris: 85,-
		Kartbilag:	
Feltarbeid utført:	Rapportdato: 10.09.85	Prosjektnr.: 1889	Prosjektleder: R. Boyd
Sammendrag: Humusprøver (217 stk.) med tetthet ca. 1 prøve pr 30 km ² er samlet inn i vestlige deler av Nord-Trøndelag, forasket og analysert på 29 elementer med HNO ₃ /ICP. Resultatene presenteres i form av analyselister, korrelasjonsmatrise og symbolkart med frekvensfordelingskurve.			
Emneord	Nord-Trøndelag	Humus	
	Geokjemi	ICP - 29 elementer

TABELLER

Tabell 1. Analyselister med askeprosent og konsentrasjon av Al, Ca, Fe, K, Mg, Na, Si, Ti, Ag, B, Ba, Be, Cd, Ce, Co, Cr, Cu, La, Li, Mn, Mo, Ni, P, Pb, Sc, Sr, V, Zn og Zr i tørrstoff.

Tabell 2. Statistiske parametre for askeprosjenter og Si(2), Al(3), Fe(4), Ti(5), Mg(6), Ca(7), Na(8), K(9), Mn(10), P(11), Cu(12), Zn(13), Pb(14), Ni(15), Co(16), V(17), Mo(18), Cd(19), Cr(20), Ba(21), Sr(22), Zr(23), Ag(24), B(25), Be(26), Li(27), Sc(28), Ce(29), La(30).

Tabell 3. Korrelasjonsmatrise for 30 variable listet i Tabell 2.

FIGURER

Fig. 1. Anomaliområder avgrenset på grunnlag av analyse av 2736 bekkesedimentprøver.

Fig. 2.1 - 2.19 Symbolkart med frekvensfordelingskurver over askeprosent og konsentrasjonen av askeprosent (AP), Ag, Ba, Be, Cd, Ce, Co, Cr, Cu, La, Li, Mo, Ni, Pb, Sc, Sr, V, Zn, Zr i tørrstoff.

INNLEDNING

Målsettingen for Nord-Trøndelags-programmet er å gjennomføre geologiske undersøkelser slik at fylkets mineralressurser blir kartlagt. Videre skal behovene for geologiske data hos brukergrupper også utenfor prospekteringsindustrien bli dekket i størst mulig grad. Feltundersøkelser innenfor geokjemi som er gjennomført per 1.januar 1984, er beskrevet i NGU-rapport 84.069.

I denne rapport presenteres resultatene som er produsert ved analyser av humusprøver. Prøveinnsamlingen ble gjennomført høsten 1982 og sommeren 1983 med prøvetakingstetthet 1 prøve per 30 km², dvs. tilsvarende den prøvetakingstetthet som er benyttet i Nordkalott-prosjektet. Området dekker hovedsaklig den delen av Nord-Trøndelag som ligger vest for riksvei E-6 pluss et kartblad (Vuku 1722I) mellom Verdalsdalføret og Ogdalsdalføret. Følgende kartblad (M1:50 000) er helt eller delvis prøvetatt:

1622 I Verran
1622 II Frosta
1622 III Ieksvik
1622 IV Åfjord
1623 I Jøssund
1623 II Holden
1624 I Vikna
1624 II Nord-Flatanger
1722 I Vuku
1722 IV Stiklestad
1723 I Overhalla
1723 II Snåsavatnet
1723 III Steinkjer
1723 IV Namsos
1724 II Skogmo
1724 III Jøa
1724 IV Kolvereid
1824 III Harran

Fra de samme områdene er det også samlet inn bekkesedimenter, bekkesmoser, bekketorv, løsmasse og bekkevann. Resultatene av analysene av disse prøvene blir rapportert etterhvert som de er ferdig analysert og kartframstilt.

Fra de samme områder, men med større prøvetetthet (ca. 1 prøve per 3 km²) foreligger et sett med 2736 bekkesedimenter. Resultatene fra dette prøvesettet er presentert i NGU-rapport 84.116.

I løpet av 1984 er det forøvrig samlet inn ca. 1200 bekkesediment prøver med prøvetetthet 1/3 km² fra områdene øst for riksvei E6 mellom Stjørdalsdalføret og Ogndalsdalføret, og ca. 550 bekkesediment-prøver med samme prøvetetthet fra den delen av Sør-Trøndelag som ligger på Fosen. I feltsesongen 1985 vil prøver fra områdene øst for E-6 og nord for Ogndalen bli samlet inn. Tidligere innsamlede prøver fra Grongfeltet er slått sammen og analyseres i løpet av sommeren 1985.

MATERIALE, ANALYSER, BEARBEIDING

Humusprøvene er samlet inn i nærheten av prøvelokalitetene der de øvrige prøvemedier er samlet inn. Prøvene represent de øverste 5-15 cm (A₀ horisonten) av jordprofilet. Fem til ti underprøver inngår i hver prøve. Prøvene ble pakket i tøyposer, tørket og forasket i laboratoriet.

En representativ 0.5 grams prøve av det foraskede materiale, ble sluttet opp i 7N HNO₃ (3 timer, 110C) og analysert med ICP emisjonsspektrometer (Jarrell Ash Mod) på 29 elementer:

Al, Ca, Fe, K, Mg, Na, Si, Ti, Ag, B, Ba, Be, Cd, Ce, Co, Cr, Cu, La, Li, Mn, Mo, Ni P, Pb, Sc, Sr, V, Zn, og Zr.

Beregning av statistiske parametre og kartfremstilling ble gjort etter standard metoder på HP3000 med Tektronix grafisk skjerm.

RESULTATER

Resultatene for 217 humusprøver som presenteres her, bør betraktes i lys av de anomaliområder som er avgrenset basert på analyse og kartfremstilling av 2736 bekkesedimentprøver:

Leksvik/Mosvik

Fines

Sela

Fosdalen

Snåsa

Skage

Skage/Grong

Harran

Kongsmoen

Områder øst for Kongsmoen

Områder øst for Jøa

Beliggenheten av disse er angitt i Fig. 1.

Resultatene for de forskjellige elementene analysert i de 217 humusprøvene presenteres her som symbolkart i alfabetisk rekkefølge (Fig. 2.1 - 2.21).

Humus

Ag

Gjennomsnittsverdi: 0.4 ppm

Laveste og høyeste verdi: 0.1 og 0.5 ppm

Prøver med de høyeste verdier ligger i områder ved Snåsavatn og på Inderøy. I øyområdene Vikna-Kolvereid ligger verdiene under deteksjonsgrensen. I Leksvik/Mosvik-området ligger kun et fåtall prøver under deteksjonsgrensen. Basert på det mønster som dannes av prøver under og over deteksjonsgrensen, synes det å være indikasjoner på anrikninger i områdene østover fra Namdalseid, nord langs Beitstadorrådet og i ytterkant av Tømmeråsantiklinalen.

Ba

Gjennomsnittsverdi: 37.3 ppm

Laveste og høyeste verdi: 4.8 og 162.5 ppm

Prøvepunktene med de høyeste verdiene ligger i Verrabotn (på sør-sida), ved Malm, på Inderøy og ved Snåsaheia. Forøvrig er det vanskelig å avgrense et regionalt fordelingsmønster.

Be

Gjennomsnittsverdi: 0.12 ppm

Laveste og høyeste verdi: 0.03 og 0.4 ppm

De fleste verdiene ligger under deteksjonsgrensen. Anomaliene er spredt på et lite antall steder; først og fremst Inderøy (sør-sida), Malm, Osen, og Vikna.

Cd

Gjennomsnittsverdi: 0.4 ppm

Laveste og høyeste verdi: 0.1 og 1.6 ppm

De høyeste verdier er funnet i prøver innsamlet sør for Leks-dalsvannet og ved Snåsaheia.

Ce

Gjennomsnittsverdi: 11.9 ppm

Laveste og høyeste verdi: 2.0 og 74.0 ppm

Det er vanskelig å gjenkjenne et regionalt mønster som eventuelt gjenspeiler et tektonostratigrafiske fordelinger. Den største tetthet med høye verdier finnes i et belte fra Vikna til Inderøy og derfra er stykke østover. De høyeste verdiene er registrert i prøver fra Vikna, Malm, og Inderøy.

Co

Gjennomsnittsverdi: 2.1 ppm

Laveste og høyeste verdi: 0.1 og 21.1 ppm

Den lave stigningen på frekvensfordelingskurva skyldes den store spredningen i dataene (to tierpotenser). Verdiene er ikke normalt fordelt, men samlet i to grupper; en med lave verdier og en med høyere verdier. De høyeste verdiene er i prøver fra Inderøya, Malm, og Osen.

Cr

Gjennomsnittsverdi: 4.2 ppm

Laveste og høyeste verdi: 0.4 og 49.8 ppm

Frekvensfordelingskurven for krom har relativt lav stigning. De høyeste verdiene ligger i områdene Leksvik, Inderøy (vestlige del), sydvest for Namdalseid (ved fylkesgrensen) og på Otterøya. Dessuten er det eleverte verdier i sydligste del av kartblad Vuku (mot Verdalen).

Cu

Gjennomsnittsverdi: 7.0 ppm

Laveste og høyeste verdi: 2.2 og 24.9 ppm

Frekvensfordelingskurven gjenspeiler en bimodal fordeling. Ingen verdier er spesielt høye. De høyeste verdiene ligger i områdene Vikna-Kolvereid og Leksvik-Mosvik.

La

Gjennomsnittsverdi: 5.4 ppm

Laveste og høyeste verdi: 0.4 og 42.1 ppm

Frekvensfordelingskurven er forholdsvis flat. De høyeste verdiene ligger midt på kartblad Vuku, vestlige deler av Inderøy, i malm ved Namdalseid og ute på Vikna.

Li

Gjennomsnittsverdi: 1.1 ppm

Laveste og høyeste verdi: 0.1 og 15.0 ppm

De høyeste verdier er funnet i Leksvik-Mosvik, vestlige områder av Inderøy, øst for Osen, på Otterøya og nordligst på Vikna.

Mo

Gjennomsnittsverdi: 16.0 ppm

Laveste og høyeste verdier: 0.1 og 2.6 ppm

De høyeste verdiene ligger på vestlige deler av Inderøy, på Røra, ved sørenden av Leksdalsvatnet og ved Kolvereid. En høy enkeltprøve ligger øst for Salsvatnet.

Ni

Gjennomsnittsverdi: 3.2

Laveste og høyeste verdi: 0.4 og 31.4 ppm

De høyeste verdiene er funnet i områdene Leksvik-Mosvik, vest på Inderøy, og øst for Osen.

Pb

Gjennomsnittsverdi: 16.0 ppm

Laveste og høyeste verdi: 4.0 og 106.0 ppm

De høyeste verdier er funnet på Snåsaheia og på Vikna.

Sc

Gjennomsnittsverdi: 0.7 ppm

Laveste og høyeste verdi: 0.1 og 4.9 ppm

De høyeste verdiene ligger nordvest for Leksvik, vest på Inderøy, i områdene rundt Namdalsfjorden.

Sr

Gjennomsnittsverdi: 35.9 ppm

Laveste og høyeste verdi: 7.3 og 137.5 ppm

Bimodal frekvensfordeling. De høyeste verdiene er påvist i Verra-bon, Mosvik, og Inderøy.

V

Gjennomsnittsverdi: 7.5 ppm

Laveste og høyeste verdi: 1.1 og 80.0 ppm

De høyeste verdier finnes i Leksvik, Mosvik, Inderøy og øst for Osen.

Zn

Gjennomsnittsverdi: 38.7 ppm

Laveste og høyeste verdi: 9.3 og 312.5 ppm

Frekvensfordelingskurven flater ut for de høyeste verdier som ligger i områdene Verrabotn og Snåsaheia.

Zr

Gjennomsnittsverdi: 0.9 ppm

Laveste og høyeste verdi: 0.1 og 6.5 ppm

De høyeste verdier er påvist i Åfjord, på Inderøy, ved Leks-dalsvatnets sørende, vest for Namdalseid, i Jøssund og på Otterøya.
